

# GXC

## A Private 4G / 5G Cellular Network

### Why GXC?

- Only Mesh solution available in the market, this eases network growth (Mesh radios only require power to extend signal coverage).
- Backed by Motive for a complete turnkey solution.

### Why private cellular network?

- Hardened security with end-to-end encryption
- Four (4x) times the coverage per radio when compared with Wi-Fi.
- Reliability
- Mobile Connectivity
- Quality of Service (QoS)

### Why would you switch an existing WiFi infrastructure to GXC?

- Private Cellular is the future of connectivity in critical infrastructure for enterprise environments, this is due to the growing use of robotics and automation where connectivity reliability is a must have.
- Mitigates wireless signal interference issues that are highly common in Wi-Fi.
- Does not need to replace Wi-Fi in all areas, Wi-Fi can still be used for non-critical business operations in smaller spaces.
- The technology used in private cellular operates with the same quality as the public cellular networks (AT&T, T-Mobile, Verizon) to provide worldclass connectivity in larger spaces (cities).
- If Wi-Fi is still necessary, private cellular allows the use of Wi-Fi hotspots to connect non-cellular devices.
